

The internet is one of the most important inventions in the history of mankind. Without it much of the modern lifestyle we enjoy would be but the fevered dream of a mad man. In my life I have endless uses for the World Wide Web. High speed internet is an incredible luxury. Before my family upgraded to the speed of our current connection, we had to deal with the painstakingly slow dial up connection. Back in those dreadful days it would take me hours just to do research for my classes, whereas now I can have all of my material and be working on my assignment in a fraction of the time. I can only imagine how the internet will affect my future.

I plan on going to the University of Iowa and eventually becoming a cardiac surgeon. Considering the amount of education involved in such a profession, I know I will need the internet more than ever in the coming years. Once I attain my goal my need for the internet will not subside though.

As a surgeon the internet will have a tremendous impact upon my career. In the current medical field doctors use the internet daily to stay updated on the correct dosages of medication and the new threats to their patients. There are even websites created especially for medical professionals that only medical professionals can access so that they can be informed of important information that could end up saving a patient's life. The medical field is also affected by the internet in regards to lab work. If it were not for the swiftness of the internet any results from a lab that was not in the building would take days or even weeks to reach its destination by ordinary mail.

In short the internet is everywhere so that makes it one of the most important aspects of my life and my future.
